

Applying Safari 20 SG by Trunk Spray – Master Batch

IMPORTANT	CONVERSION FACTOR
Use the special marked measuring cup that comes with your purchase of Safari to measure the required amount of product and a regular measuring cup to measure the amount of water. Note that the numbers printed on the special measuring cup refer to <i>ounces of weight</i> of Safari 20 SG and are <i>not</i> the same as <i>fluid ounces of volume</i> in a regular measuring cup.	If you don't have the special measuring cup, you can use a regular measuring cup with the following conversion factor for Safari 20 SG: 8 fl. oz. by volume in a regular measuring cup = 4 oz. by weight in the Safari measuring cup.

Wear long sleeved shirt, long pants, shoes and socks, goggles, gloves, and mask while spraying.

Step 1. To make a **master batch of treatment mixture**, put the required amount of water in a mixing container first. **Warm water** works best. Then add the corresponding amount of product shown in the Mixing chart below and shake well until all treatment material is dissolved.

MIXING THE MASTER BATCH	
Amount of Product	Amount of Water
3.5 ounces	32 fluid ounces (1 qt)
7 ounces	64 fluid ounces (2 qts)
10.5 ounces	96 fluid ounces (3 qts)
12 ounces	110 fluid ounces
14 ounces	128 fluid ounces (1 gal)

Step 2. Measure the trunk diameter of the tree at breast height. This is called “inches dbh.”

Step 3. Treatment is done on an **individual tree** basis. Use the Dosing table below to determine how many ounces of treatment mixture the tree needs by multiplying its trunk diameter by the number of ounces shown in the right-hand column. Use a regular measuring cup to measure out exactly the required amount of treatment mixture for the tree and pour it into the sprayer.

DOSING EACH TREE	
Inches (DBH)	Oz of TREATMENT MIXTURE per Inch DBH
1 - 15	1 ounce
16 – 19	1.33 ounces
20 – 23	1.67 ounces
24 – 27	2 ounces
28 – 31	2.33 ounces
32 – 35	2.67 ounces
36 – 39	3 ounces
40 or greater	3.33 ounces

Step 4. Set the sprayer for low pressure (10-15 psi) and adjust the nozzle for a spray about 3-4 inches wide (not a stream and not a mist). Position the nozzle 2 inches from the trunk and spray from 5 ½ feet above the ground to 6 inches above the ground. Do this very slowly to avoid back-splash and allow the treatment material to be absorbed into the bark; try not to let it drip down onto the ground if the tree is immediately next to a waterway or other sensitive area. Spray until the sprayer is empty so you use all of the treatment mixture on the intended tree.

NOTE: If the spray is too foamy, you can add a cup or two of water in the sprayer tank after you've loaded the required amount of treatment mixture into it.

Step 5. When you're finished treating each tree, mark it to indicate it's been treated. Give the treatment time to dry before children or pets are allowed in the area.

Applying Safari 20 SG by Trunk Spray – Small Custom Batch

<p>IMPORTANT</p> <p>Use the specially marked measuring cup that comes with your purchase of Safari to measure the required amount of product and a regular measuring cup to measure the amount of water. Note that the numbers printed on the special measuring cup refer to <i>ounces of weight</i> of Safari 20 SG and are <i>not</i> the same as <i>fluid ounces of volume</i> in a regular measuring cup.</p>	<p>CONVERSION FACTOR</p> <p>If you don't have the special measuring cup, you can use a regular measuring cup with the following conversion factor for Safari 20 SG:</p> <p>8 fl. oz. by volume in a regular measuring cup = 4 oz. by weight in the Safari measuring cup.</p>
---	---

Wear long sleeved shirt, long pants, shoes and socks, goggles, gloves, and mask while spraying.

Step 1. Measure the trunk diameter of the tree at breast height. This is called “inches dbh.”

Step 2. To make a **small custom batch of treatment mixture**, put the required amount of water in a mixing container first. Refer to the chart below. **Warm water** works best.

Step 3. Then add the corresponding amount of product shown in the chart below and shake until all treatment material is dissolved.

MIXING & DOSING		
Inches (DBH)	Amount of Product per Inch	Amount of Water per inch
1 – 15	0.1 oz = 3 grams	2 fluid ounces
16 – 19	0.133 oz = 4 grams	2 fluid ounces
20 – 23	0.167 oz = 5 grams	2 fluid ounces
24 - 27	0.2 oz = 6 grams	2 fluid ounces
28 – 31	0.233 oz = 7 grams	2 fluid ounces
32 – 35	0.267 oz = 8 grams	2 fluid ounces
36 – 39	0.3 oz = 9 grams	2 fluid ounces
40 or greater	0.33 oz = 10 grams	2 fluid ounces

Step 4. Treatment is done on an **individual tree** basis. Use the Dosing table below to determine how many ounces of treatment mixture the tree needs by multiplying its trunk diameter by the number of ounces shown in the right-hand column. Use a regular measuring cup to measure out exactly the required amount of treatment mixture for the tree and pour it into the sprayer.

Step 4. Set the sprayer for low pressure (10-15 psi) and adjust the nozzle for a spray about 3-4 inches wide (not a stream and not a mist). Position the nozzle 2 inches from the trunk and spray from 5 ½ feet above the ground to 6 inches above the ground. Do this very slowly to avoid back-splash and allow the treatment material to be absorbed into the bark; try not to let it drip down onto the ground if the tree is immediately next to a waterway or other sensitive area. Spray until the sprayer is empty so you use all of the treatment mixture on the intended tree.

NOTE: If the spray is too foamy, you can add a cup or two of water in the sprayer tank after you've loaded the required amount of treatment mixture into it.

Step 5. When you're finished treating each tree, mark it to indicate it's been treated. Give the treatment time to dry before children or pets are allowed in the area.
